Years with TYLin

8 Years

Education

BS, Civil Engineering, University of South Carolina, 2010

License

Professional Engineer 123489, Texas, 2016
050202, NC, 2020

Certifications

Project Management Professional, PMI #1877169 PMP, 2015

AAAE C.M. #269063

Proficiencies (e.g. software)

Microsoft Project Fundaments, PPM Global Services, 08/2020

Primavera P6 Professional Fundamentals

AVIATION

William Christopher Tolleson, PE, PMP

Mid-Atlantic Sector Manager

Chris Tolleson is a project manager and civil engineer with more than 15 years of experience in engineering design, project management, and project controls in the aviation, construction, and nuclear industries. Currently, Chris is serving as the Mid-Atlantic Sector Manager and acts as a Deputy Program Manager at the Charlotte-Douglas International Airport (CLT). There, he performs Project Management, Estimating, Design Review, Contract Negotiation and Construction Administration services. Chris serves as an extension of CLT staff under TYLin's existing on-call Project & Construction Management contract. Prior to joining TYLin, Chris worked as a Professional Design Engineer in the commercial nuclear power industry and led his own engineering consulting firm, Tolleson Engineering Consultants in Granbury, Texas.

PROJECT EXPERIENCE

City of Charlotte Aviation Department, Charlotte-Douglas International Airport (CLT), Project Management/Construction Administration | Charlotte, NC, USA

TYLin Project # | Aviation | Construction Value | Delivery Method | Deputy Program Manager

Deputy Program Manager responsible for managing and implementing the design and construction of airport projects. Supervising and providing technical advice, information and assistance to co-workers, consultants, contractors and others regarding procedures, regulations and standards. Organizes, prioritizes and coordinates work activities, tracks status of work in progress, and prepares monthly reports to inform CLT leadership of project status. TYLin is providing project management and construction administration services for various CLT construction projects, including without limitation, establishing and maintaining project schedules and budgets, quality assurance, risk management, coordinating the work of contractors with CLT operations, and other services incidental to aviation project management.

Concourse A Expansion Phase 1 – Concourse A Expansion is a $142 million expansion to the north of existing Concourse A. This new pier addition increased the terminal footprint by more than 215,000 square feet. Concourse A Expansion added 9 gates and 12 new concessions. Additionally, the project installed the largest digital art piece in the world. The concourse pier of Concourse A Expansion is a 300-linear-foot steel and cast-in-place concrete hybrid structure with a 1,000-linear-foot hybrid connector. Major features of this project included the use of electrochromic "self-tinting" glass, custom forged steel column bases—uniquely exclusive to this project, Arconas power "charging-enabled" holdroom seating, and 85,000 square feet of high strength terrazzo flooring. This program established the guidelines and standards for all wayfinding and signage for the entire terminal. Since this project, CLT has replaced all signage within the terminal complex with this standard. The project was implemented using the Construction Manager at Risk (CMAR) alternative delivery method and achieved a Green Building Institute, Green Globe Certification.

Concourse A Renovation – Concourse A Renovation was a $41M CMAR renovation and expansion project of the existing Concourse A. The 4-phase project closed 7-8 gates for the first two phases while the structure was widened 55 LF to the south while keeping airline operations online. Concourse A Renovation consisted of complete renovation of 13 gates, expanded holdrooms, 2 relocated restrooms, 4 new concessions, public art, terrazzo resinous flooring in the circulation corridor and new holdroom furniture. These

renovations and expansions were performed while maintaining airline and airport operations within the concourse. Scope included new jet fuel vaults, relocated pits and new connections to the fuel; in addition to new main switchgear replacements, emergency generator replacement, air handler replacements and below grade grease interceptor installations. Chris devised the phasing strategy for temporary chillers, air handlers, generators, spot coolers and a modular wall system that allowed the concourse to maintain operations while simultaneously relocating restrooms, concessions, offices and holdrooms. A key takeaway from this project was the excessive number of Requests for Information (RFIs) that inundated the design and owner teams. To navigate this strategy, Chris created a new process workflow branch, the Request or Deviation (RFDs), within the RFI process that allowed designers and owners to separate frivolous RFIs from legitimate ones and recover design expenses by way of deductive change orders when contractors attempted to generate scope via the RFI process. This type of technical expertise, combined with initiative for the owner's best interests, exemplifies why Chris and his team have been repeatedly engaged in delivering projects for the same clients over the last 13 years.

eBuilder Implementation Project– The eBuilder Implementation Project at the Charlotte Douglas International Airport established new processes for various workflows within the Project Management Information System (PMIS), Unity Construct (formerly eBuilder). This effort created the baselines and standards currently used at CLT for forecasting, cash flow, cost module, schedule management, and the New Project Request (NPR) process used by the City of Charlotte today. Chris acted as the Project Manager for this project which was tasked to integrate the PMIS software with the existing CLT financial software. At completion, this project defined how CLT Project Management processes are executed for all projects from planning, through design and closeout after construction. Chris sits on the CLT Unity Construct Advisory Committee and counsels on potential process improvements for the City of Charlotte Aviation Department.

Project Management Handbook – The Charlotte Douglas International Airport requested Subject Matter Expertise in developing and authoring a guideline for project delivery. This effort led to the implementation of a consistent standard for the entire Project Management Office to refer to when executing Project Management activities, deliverables, and workflows. Chris engaged with CLT's Program Advisory Services vendor to ensure that the handbook product met the current requirements and processes that CLT Project Managers deliver in their daily project activities. Chris acted as the Subject Matter Expert for construction management, AHJ policy, PMIS integration and CLT Governance compliance.

Concourse A Expansion Phase 2 – Concourse A Expansion Phase 2 is a $241M terminal project which added another pier to the Concourse A Expansion Program. Concourse A Expansion Phase 2 provided 195,000 SF to the terminal complex as well as 10 additional gates, 6 new concessions, a 15,000 SF Delta SkyClub on the mezzanine, over 50,000 SF of ramp level offices for airline operation, 3 new Make-Up Carousels, 3 Manual Encoding Stations and 1.35 miles of conveyor which added redundancy lines for the west matrix of CLT's Baggage Handling System. This project opened on September 16th, 2024, within budget and on schedule for first flights. Concourse A Expansion Phase 2 was awarded the Association of Builders and Contractors Eagle Award in 2025. Concourse A Expansion Phase 2 has pioneered the new airport standard project controls reporting, execution of the PMIS implementation improvements and governance compliance. New CLT architectural initiatives were installed on Concourse A Expansion Phase 2 for the first time at CLT and the execution of these enhancements led to the incorporation of similar features in dozens of new projects such as a restored McDonnell Douglas MD-82 plane tail displayed inside the concourse, a matching "to-scale" outline of the MD-82 embedded

into the terrazzo flooring, a stretched fabric ceiling backlit system and a series of embedded brass medallions within the terrazzo floor system that were custom engraved with Wright Flyer details from the famous Kitty Hawk first sustained flight

Concourse B/C Circulation Improvements – Concourse B & C Circulation consisted of relocating and optimizing holdroom furniture, gate counters, gate podiums, closets, life safety devices and associated infrastructure. The existing conditions of the gate counter and associated podiums were perpendicular to the main circulation corridor aligned in the center of the concourses. This condition led to passenger queuing congestion within the circulation corridor, inefficient utilization of holdroom furniture, and unusable areas within leased footprint. This project ran new CAT5 horizontal network infrastructure to relocated boarding slab penetrations and rotated the millwork such that the passenger queue lines are formed within their intended holdrooms. This project rotated and relocated the millwork for the 8 closest holdrooms to the main atrium so that circulation was no longer constricted at the start of the concourses. This project was executed completely on 3rd shift and was demobilized entirely each morning before 5 am to ensure that the first bank of flights were unaffected by this project. No airline operations were delayed or affected by this project.

AED Retrofit and Enhancement Project – CLT airport has added 155 AED cabinets and infrastructure around the airport property. Chris managed this project from conception to closeout by authoring contracts for construction and design, engaging various Airport stakeholders (IT, Landside and Terminal Operations, Facilities, and Security), and Contract Administration through construction. This project has installed AED cabinets within all parking decks, cargo facilities, Central Energy Plant, the main Atrium, all levels of all concourses and the CLT Joint Operations Center.

Ongoing CLT Projects include:

- **Concourse A Modification**
- **D/E Connector**
- **BHS Transfer Line TX-03**
- **Concourse C Expansion**
- **Early Bag Storage (EBS)**

City of Charlotte Aviation Department, Charlotte-Douglas International Airport (CLT), East Terminal Expansion | Charlotte, NC

Project Manager

The $34M East Terminal Expansion at the Charlotte Douglas International Airport expanded the Terminal Complex on the East Side of the Ticket Lobby. This project added Security Checkpoint E, expanded the East Chiller Plant, provided hydronic water to the Hourly Deck/Rental Car Facility, added penthouse space for additional air handlers and added office level space above ticket level. This project laid the foundation for what is now the Plaza food court and the East Terminal Expansion Phase 2 Project.

EXPERIENCE PRIOR TO TYLIN

Waterford 3 Fukushima N1 Storage Building

Project Manager

The $85M Fukushima N1 Building in Killona, Louisiana, was located on top of the active Reactor Auxiliary Building southwest of New Orleans Louisiana. The N1 building added a redundant emergency generator and support equipment in addition to Waterford's emergency safe shutdown equipment. This additional equipment was suspended above the levee and MSL surge line to ensure redundant and flood resistant equipment was available in the event of a seismically activated flooding condition. This structure was installed on top the active operating reactor auxiliary building housing pumps, heat exchangers and electrical equipment.

Comanche Peak Fukushima FLEX Storage Building

Project Manager

The Fukushima FLEX Building was a Beyond Design Basis – SSE (Safe Shutdown Earthquake) and OBE (Operating Basis Earthquake) resistant 26 FT tall reinforced concrete structure in Glen Rose Texas. The FLEX Building's purpose is to store pumps, generators and emergency equipment to administer cooling and emergency power after a complete failure of the plant emergency systems. This program encompassed a $25M budget to mitigate the Fukushima tragedy.

Arkansas Nuclear One Emergency Diesel Generator Replacement

Project Manager

Two independent trains of Emergency Diesel Generators and associated control cabinets required replacements due to aging and obsolete unsupported equipment. The Woodward EGA/EGB-10C speed control systems were no longer supported by Woodward. The seismic evaluation was based on components resisting existing dynamic acceleration using Design Basis Event loading.
